Listing of Claims:

- 1. (previously presented) A plug baffle device for installation in a coolant passage of a mold, the plug baffle device comprising a coolant-encountering fin and a base member in tolerance-fit tight mechanical engagement therewith mechanically immovably affixed thereto, the base member having a mold-connecting portion.
- 2. (original) The plug baffle device of claim 1 wherein the base member is mechanically attached to the coolant-encountering fin through a mating connection.
- 3. (original) The plug baffle device of claim 2 wherein the mating connection is accomplished by a male interconnecting member and a female interconnecting member.
- 4. (original) The plug baffle device of claim 3 wherein the male interconnecting member is integral with the coolant-encountering fin and the female interconnecting member is integral with the base member.
 - 5. (original) The plug baffle device of claim 4 wherein:
 - the female interconnecting member defines a fin-receiving channel having a channel cross-section; and
 - the male interconnecting member has a base-engaging portion with a base-engagingportion cross-section complementary to the channel cross-section.
- 6. (original) The plug baffle device of claim 5 wherein the base-engaging-portion cross-section is T-shaped.

Page 3

- 7. (previously presented) The plug baffle device of claim 5 wherein the base member has first and second ends and includes:
 - a mold-connecting portion that is substantially cylindrical, has a threaded outer surface, and defines a tool-engaging socket opening at the first end of the base member; and
 - an extension portion that extends from the mold-connection portion to form the second end of the base member, the extension portion having the female interconnecting member.
- 8. (original) The plug baffle device of claim 7 wherein the tool-engaging socket has an axial depth which is at least 80% of the axial length of the threaded outer surface.
- 9. (original) The plug baffle device of claim 8 wherein the tool-engaging socket has an axial depth which is at least 90% of the axial length of the threaded outer surface.
- 10. (previously presented) The plug baffle device of claim 7 wherein the extension portion narrows in cross-dimension toward the fin, thereby to provide lateral flow space adjacent thereto.
- 11. (previously presented) The plug baffle device of claim 1 wherein the base member has first and second ends and includes:
 - a mold-connecting portion that is substantially cylindrical, has a threaded outer surface,
 and defines a tool-engaging socket opening at the first end of the base member; and
 - an extension portion that extends from the mold-connection portion to form the second end of the base member, the coolant-encountering fin being attached thereto.

Page 4

- 12. (previously presented) A plug baffle device for installation in a coolant passage of a mold, the plug baffle device comprising:
 - · a coolant-encountering fin; and
 - a base member mechanically attached thereto, the base member having first and second ends and including (A) a substantially cylindrical mold-connection portion which has a threaded outer surface and defines a tool-engaging socket opening at the first end of the base member, the tool-engaging socket having an axial depth which is at least 80% of the axial length of the threaded outer surface, and (B) an extension portion that extends from the mold-connection portion to form the second end of the base member, the coolant-encountering fin being attached thereto.
- 13. (original) The plug baffle device of claim 12 wherein the tool-engaging socket has an axial depth which is at least 90% of the axial length of the threaded outer surface.
- 14. (previously presented) The plug baffle device of claim 12 wherein the extension portion narrows in cross-dimension toward the fin, thereby to provide lateral flow space adjacent thereto.
 - 15. (previously presented) A plug baffle device comprising:
 - · a coolant-encountering fin having a base-member-engaging portion; and
 - a base member defining an axis and defining a female fin-receiving portion which is in tolerance-fit tight mechanical engagement with mechanically immovably affixed to the fin.
 - 16. (cancelled).

Page 5

- 17. (original) The plug baffle device of claim 15 wherein:
- the female fin-receiving portion defining a fin-receiving space which has an axiallyfacing entrance of first cross-sectional area, the fin-receiving space having a second cross-sectional area axially spaced from the entrance, the second cross-sectional area being greater than the first cross-sectional area; and
- the base-member-engaging portion of the fin has a third axial cross-sectional area greater than the first cross-sectional area, thereby preventing axial disengagement of the fin from the base member.
- 18. (original) The plug baffle device of claim 17 wherein:
- the base-member-engaging portion has a trans-axial cross-sectional shape which is substantially constant along at least a segment of the width thereof, and
- the fin-receiving space is a trans-axial channel configured and arranged to be substantially complementary to the base-member-engaging portion.
- 19. (original) The plug baffle device of claim 18 wherein the trans-axial cross-sectional shape is T-shaped.
- 20. (original) The plug baffle device of claim 15 wherein the fin has a coolant-contacting portion which is plate-like.
- 21. (original) The plug baffle device of claim 15 wherein the fin has a coolant-contacting portion which is helical.

Page 6

- 22. (previously presented) The plug baffle device of claim 15 wherein the base member has first and second ends and includes:
 - a mold-connecting portion that is substantially cylindrical, has a threaded outer surface,
 and defines a tool-engaging socket opening at the first end of the base member; and
 - an extension portion that extends from the mold-connection portion to form the second end of the base member, the coolant-encountering fin being attached thereto.
 - 23. (previously presented) A plug baffle device comprising:
 - a coolant-encountering fin having a base-member-engaging portion; and
 - a base member mechanically attached thereto and defining an axis, the base member having first and second ends and including (A) a substantially cylindrical mold-connection portion which has a threaded outer surface and defines a tool-engaging socket opening at the first end of the base member, the tool-engaging socket having an axial depth which is at least 80% of the axial length of the threaded outer surface, and (B) an extension portion that extends from the mold-connection portion to form the second end of the base member and forms a female fin-receiving portion with which the base-member-engaging portion of the fin is mechanically attached.
- 24. (original) The plug baffle device of claim 23 wherein the tool-engaging socket has an axial depth which is at least 90% of the axial length of the threaded outer surface.
- 25. (previously presented) The plug baffle device of claim 23 wherein the extension portion narrows in cross-dimension toward the fin, thereby to provide lateral flow space adjacent thereto.

Claims 26-28 (cancelled)
